                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                            The invention relates to a novel short interfering RNA (siRNA) nuclei acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HERA, K-Ras, H-Ras, N-man immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ65217 - ABZ66538 - ABZ66539 - ABZ66539 - ABZ66539 approsent human ribozymes of incomplete.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABZ66649;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABZ66649 standard; RNA; 29

That modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, H-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ665217 - ABZ66532 - ABZ65539, ABZ66529, ABZ66528 - ABZ66529 represent human ribozymes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, overian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66529, ABZ66528 - ABZ66529, ABZ66529, ABZ66528 - ABZ66529, ABZ66529
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ65217 - ABZ66533 - ABZ65519, ABZ66525 - ABZ66529, ABZ66528 - ABZ66528 represent human ribozymes of timestrice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 122; Page 159; 185pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    XXXDDDDDDDDDDDDDDDDDDDDDDDXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA
CC which comprises a catalytic domain that cleaves mRNA at a defined
CC consensus sequence and binding domains contiguous with the 5' and 3' ends
CC of the catalytic domain. Lack of expression of the hairless gene due to
CC inherited mutations leads to the complete loss of hair, known as
CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting
CC the genes promoting hair growth, and one way to get targeted, transient
CC gene suppression is through the use of catalytic nucleic acid technology,
CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have
CC aself-catalytic enzymatic function and sequence specific RNA binding
CC ability. Small DNA oligonucleotides that have a similar structure to the
CC definity. Small DNA oligonucleotides that have a similar structure to the
CC catalytic core and two sequence specific arms. The deoxy-ribozymes have
CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids
CC degrade, in vivo, that hammerhead ribozymes. The catalytic mucleic acids
CC degrade, in vivo, that hammerhead ribozymes for inhibiting hair production
CC by a hair-producing cell, for inhibiting hair growth and for inhibiting
CC the transition of a hair follicle from the anagen phase to the catagen
CC the phase. A non-human transgenic mammal is useful as model for testing
CC expression. The sequence presented is the deoxy-ribozyme that cleaves the
CC the phase in the products which function by inhibiting hairless protein
CC the phase in the product of the presented is the deoxy-ribozyme that cleaves the
CC the phase in the product of the presented is the deoxy-ribozyme that cleaves the
CC the production by inhibiting hairless protein
CC the production by inhibiting hairless protein

CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as a trichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology. CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the catalytic core and two sequence specific arms. The deoxy-ribozymes have CC more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catalgen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New catalytic nucleic acid molecule that specifically cleaves Hairless protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC of the catalytic domain. Lack of expression of the hairless gene due to conherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, concluding ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding cability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a ccatalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting thair growth and for inhibiting cell for inhibiting hair growth and for inhibiting thair growth and products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1641.

                                                                                                                                                                                                                                                                                                                                                                                                                                  CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC inherited mutations leads to the complete loss of hair, known as CC inherited mutations leads to the complete loss of hair, known as CC attrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting CC gene suppression is through the use of catalytic nucleic acid technology. CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the CC hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have core lenient consensus cleavage site requirements and are less likely to care useful in whormaceirions for inhibiting have recalmented acids.
                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1698.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses a new catalytic DNA or RNA molecule that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 3; Page 34; 65pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         misc_feature

                                                                                                                                  S
                                                                                                                                                                                                                                                          CC inherited mutations leads to the complete loss of hair, known as complete loss of hair, known as a trichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, hirsutism, can be improved by inhibiting the gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes apecific RNA binding complete including ribozymes and DNAzymes. Ribozymes appecific RNA binding complete including ribozymes and DNAzymes. Ribozymes or DNAzymes, which have a self-catalytic small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a contalytic core and two sequence specific arms. The deoxy-ribozymes have compensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen compasses. A non-human transgenic mammal is useful as a model for testing chair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1732.
                                                                                                                                                                           Query Match

The invention discloses a new catalytic DNA or RNA molecule that CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to cinherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called decay-ribozymes or DNAzymes, having a CC atalytic core and two sequence specific arms. The deoxy-ribozymes have CC more lenient consensus cleavage site requirements and are less likely to CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting that removal products which function by inhibiting hairless protein CC expression. The sequence presented is the deoxy-ribozyme that cleaves the CC human hairless protein mRNA immediately after nucleotide 1750.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Catalytic DNA; catalytic RNA; hairless protein; 88; hair loss; atrichia; hair growth; hisutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase; hair removal product;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2003-093020/08

  CC The invention discloses a new catalytic DNA or RNA molecule that CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5 and 3 ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonuclectides that have a similar structure to the CC degrade, in vivo, that hammerhead ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producting cell, for inhibiting hair growth and for inhibiting the transition of a hair folicie from the anagen phase to the catagen CC hair removal products which function by inhibiting hair products the carenter the segment of in the denoy-ribozyme the carenter the segment of in the denoy-ribozyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 3; Page 34; 65pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           to catagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein mRNA, useful for inhibiting cell, or for inhibiting transition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

                       specifically cleaves, or inhibits expression of, Hairless Protein mRNA which comprises a catalytic domain that cleaves mRNA at a defined consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding ability. Small DNA oligonucleotides that have a similar structure to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         degrade, in vivo, that hammerhead ridozymes. The catalytic mare useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 1811.
                       specifically cleaves, or inhibits expression of, Hairless Protein which comprises a catalytic domain that cleaves mRNA at a defined consensus equence and binding domains contiguous with the 5' and of the catalytic domain. Lack of expression of the hairless gene of the catalytic domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ribozyme; atrichia; hair growth; hirsutism; catalytic nucleic acid; ribozyme; DNAzyme; self-catalytic; hammerhead ribozyme; deoxy-ribozyme; catalytic core; cleavage site; pharmaceutical; hair production; hair follicle; anagen phase; catagen phase.
                                                                                                                                                                                                                                                                                                               New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC the genes promoting hair growth, hirsutism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC ability. Small DNA oligonucleotides that have a similar structure to the CC hammerhead ribozyme, called decay-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The decay-ribozymes have more lenient consensus cleavage site requirements and are less likely to CC degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting CC the transition of a hair follicle from the anagen phase to the catagen CC phase. A non-human transgenic mammal is useful as a model for testing CC hair removal products which function by inhibiting hairless protein CC catalytics protein mRNAA immediately after nucleotide 2028.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

which comprises a Calcalytic domain. Like Coleves make to consensus sequence and binding domains contiguous with the 5' and 3' ends of the catalytic domain. Lack of expression of the hairless gene due to inherited mutations leads to the complete loss of hair, known as atrichia. Abundant hair growth, hirsuitism, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, transient gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding abbility. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes of DNAzymes, having a have

specifically cleaves, or inhibits expression of, Hairless Protein which comprises a catalytic domain that cleaves mRNA at a defined The invention discloses a new catalytic DNA or RNA molecule that

are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen phase. A non-human transgenic mammal is useful as a model for testing hair removal products which function by inhibiting hairless protein expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 2033.

hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have more lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids

Lack of expression of the hairless gene due to ce inherited mutations leads to the complete loss of hair, known as catalytic domain. Lack of expression of the hairless gene due to ce inherited mutations leads to the complete loss of hair, known as catalytic by the gene suppression is through the use of catalytic nucleic acid technology, cincluding ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding catalytic core and two sequence specific arms tructure to the catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids care useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catalyen phase. A non-human transgenic mammal is useful as a model for testing thair removal products which function by inhibiting hair products are converged to the catalyen the serious and the serious and the serious the catalyen that removal products which function by inhibiting hair provent that cleaves the catalyen that removal products which function by inhibiting hair provent that cleaves the catalyen that the catalyen the serious protein and the serious protein the serious protei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC of the catalytic domain. Lack of expression of the hairless gene due to conherited mutations leads to the complete loss of hair, known as catalytic domain hair growth, hirsuitsm, can be improved by inhibiting the genes promoting hair growth, and one way to get targeted, translent gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding catality. Small DNA oligonucleotides that have a similar structure to the chammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a catalytic core and two sequence specific arms. The deoxy-ribozymes have come lenient consensus cleavage site requirements and are less likely to degrade, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen catalyte endeaves which function by inhibiting hairless protein the expression. The sequence presented is useful as a model for testing

cleaving hairless protein mRNA after nucleotide

2395

Catalytic DNA; catalytic RNA; hairless protein; ss; hair loss; atrichia; hair growth; hirsutism; cataly

catalytic nucleic acid;

```
CC specifically cleaves, or inhibits expression of, Hairless Protein mRNA CC which comprises a catalytic domain that cleaves mRNA at a defined CC consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC the genes promoting hair growth, and one way to get targeted, transient CC gene suppression is through the use of catalytic nucleic acid technology, including ribozymes and DNAzymes. Ribozymes are RNA structures which have a self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have catalytic core and two sequence specific arms. The deoxy-ribozymes have useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen CC hair removal products which function by inhibiting hairless protein CC expression. The sequence presented is the deoxy-ribozyme that cleaves the human hairless protein mRNA immediately after nucleotide 2380.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New catalytic nucleic acid molecule that specifically cleaves Hairless Protein mRNA, useful for inhibiting hair production by a hair-producing cell, or for inhibiting transition of a hair follicle from anagen phase

Consensus sequence and binding domains contiguous with the 5' and 3' ends CC of the catalytic domain. Lack of expression of the hairless gene due to CC inherited mutations leads to the complete loss of hair, known as CC atrichia. Abundant hair growth, hirsutism, can be improved by inhibiting CC gene suppression is through the use of catalytic nucleic acid technology, CC including ribozymes and DNAzymes. Ribozymes are RNA structures which have CC including ribozymes and DNAzymes, Ribozymes are RNA structures which have CC as self-catalytic enzymatic function and sequence specific RNA binding CC ability. Small DNA oligonucleotides that have a similar structure to the hammerhead ribozyme, called deoxy-ribozymes or DNAzymes, having a CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC catalytic core and two sequence specific arms. The deoxy-ribozymes have CC catalytic core and two sequence specific arms. The deoxy-ribozymes have compared, in vivo, that hammerhead ribozymes. The catalytic nucleic acids are useful in pharmaceutical compositions for inhibiting hair production by a hair-producing cell, for inhibiting hair growth and for inhibiting the transition of a hair follicle from the anagen phase to the catagen catalytic nucleic acids are removal products which function by inhibiting hairless protein CC hair removal products which function by inhibiting hairless protein CC human hairless protein mRNA immediately after nucleotide 2395.

```
CC gene, and a sequence of interest which produces a RNA template from the reverse transcriptase synthesises cDNA of a specified sequence. CC which the reverse transcriptase synthesises cDNA of a specified sequence. CC taking advantage of the stem-loop structure of the cDNA, which forms as CC a result of the inclusion of a inverted tandem repeat that allows the scDNA to fold back on itself, forming a double stranded DNA stem, in CC sequence of interest. The double-stranded stem contains one or more functional genetic elements (GB), adapted for incorporation into a vector CC for delivery to a cell. The vectors are is useful for producing a sbDNA CC sequence of interest, particularly a cDNA transcript, an inhibitory mucleic acid molecule which is an antisense sequence or aptamer, an meNA CC transcript and a heteroduplex molecule. Inhibitory nucleic acid molecules to a target cell are useful for alleviating pathological conditions by regulating gene expression. The present oligonucleotide was used to cc produce a vector for use in the course of the invention.
                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes methods for producing single-stranded cDNA (sscDNA) in eukaryotic cells. They use a DNA cassette that produces sscDNA in vivo. The cassette contains the Moloney murine leukemia virus reverse transcriptase/RNase H, a bacterial restriction endonuclease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genetic element for producing and delivering single-stranded DNA, comprises a gene encoding reverse transcriptase and a sequence of interest flanked by an inverted tandem repeat and primer binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide 5'-polyNM-gaglink-(Pleio)-DNase-1023-B/P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Reverse transcriptase; RNase H; stem-loop structure; genetic element; inverted tandem repeat; vector; inhibitory nucleic acid;

                                                                                                                                                                                                                                                                      В
                                                                                                                                                                                                                                                                                                  Ś
                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides novel modified ribozymes that have 3 or more pyrimidine nucleotides (PMN) in the ribozyme modified at the 2'-position, CC where the PMNs are modified to 2'-amino PMNs and the ribozymes exhibit improved stability to RNAsee degradation and exhibits 85% or more CC improved stability to RNAsee degradation and exhibits 85% or more CC invention are selected from rat and human protein kinase C (PKC) alpha Cribozymes, rumour necrosis factor (TMP) alpha ribozyme, rat and human CC ribozymes, tumour necrosis factor (VEGP) ribozymes. These ribozymes can CC be used for treating or preventing a disease or condition responsive to CC an alteration in the expression of a gene, where the ribozyme is capable CC creating or preventing a disease or condition associated with the CC proliferation of rapidly dividing cells, e.g. cancer such as malignant CC ploma. They can also be used for inhibiting the proliferation of cells. The use of 2'-amino modified pyrimidine can provide ribozyme of improved CC stability which retain the activity of the unmodified ribozyme. The
                                                                                                                                                                                                                                                                                                                                                      Query Match

target cell produces an RNA template which is reverse transcribed to produce ss-cDNA of a specified sequence. The ss-cDNA folds back on itself as a result of the inverted tandem repeat, to form a stem-loop structure. The loop is comprised of the sequence of interest. The cDNA transcript is bound to an endogenous nucleic acid target to alter expression of the target sequence. This method is useful for altering the expression of gene products e.g. c-myc or a viral gene product. It may be applied to gene therapy, with target genes mutated or introduced for therapeutic purposes, such as gene inactivation using duplex or triplex binding of nucleic acids, site-directed mutagenesis, interruption of cellular function by binding to specific cellular proteins and interfering with
                                                                                                                                                                                                                                                              The sequence represents a synthetic single stranded cDNA. This DNA in a target cell and is transfected with a cassette comprising a sof interest flanked by inverted tandem repeats (ITR) and a primer site (PBS) 3' to the tandem repeat. Transcription of the cassette
